Ideation Phase

Brainstorming – Idea Generation – Prioritization

Date	04 Feb 2026
Team ID	LTVIP2026TMIDS84828
Project Name	Financial AI Analyzer – Transforming Complex Data into Actionable Insights
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming is an important activity in the ideation phase of a project where team members collaborate to generate multiple ideas to solve a specific problem. It encourages creative thinking and allows participants to share different perspectives freely without criticism. The main goal of brainstorming is to generate a wide variety of potential solutions and then evaluate them to identify the most effective one.

During this phase, several ideas are generated, grouped, and prioritized based on feasibility, innovation, and impact. The final idea selected becomes the foundation for the project development.

Step 1: Team Gathering, Collaboration and Selection of Problem Statement:

During the brainstorming session, the team discussed common challenges faced by financial analysts, business professionals, and journalists while interpreting financial reports.

Financial documents such as balance sheets, profit and loss statements, and cash flow statements contain large volumes of numerical data and complex financial terminology. Non-financial stakeholders often struggle to interpret these reports effectively.

Manual analysis of financial statements can lead to several issues:

- Time-consuming financial analysis process
- Difficulty understanding complex financial data
- Lack of automated insights
- Risk of missing important financial trends

Selected Problem Statement

There is a need for an intelligent system that can automatically analyze financial documents and generate clear summaries and insights to help users understand financial data quickly and make better decisions.

Step 2: Brainstorm – Idea Listing and Grouping:

After identifying the problem, the team generated several possible solutions using brainstorming techniques. The goal was to explore different approaches that could simplify financial data analysis

Generated Ideas:

1. Financial Report Visualization Tool

A system that converts financial tables into graphs and charts so that users can easily understand financial performance.

2. Automated Financial Ratio Calculator

A tool that automatically calculates important financial ratios such as liquidity ratio, profitability ratio, and debt ratio.

3. AI-Based Financial Chatbot

A chatbot that allows users to ask questions about financial reports and receive instant responses.

4. AI Financial Document Analyzer

A system that automatically reads financial statements and generates insights using Artificial Intelligence.

5. Financial Data Dashboard

A dashboard that displays financial performance indicators and visual summaries in a single interface.

After listing all ideas, they were grouped according to their functionality and feasibility

Step 3: Idea Prioritization:

After brainstorming multiple ideas, the next step was to prioritize them based on two important criteria:

- **Impact:** How useful the idea is for solving the problem
- **Feasibility:** How easy it is to implement using available technologies

A prioritization matrix was used to compare the ideas.

Ideas that had high impact and high feasibility were considered the best candidates for the final project.

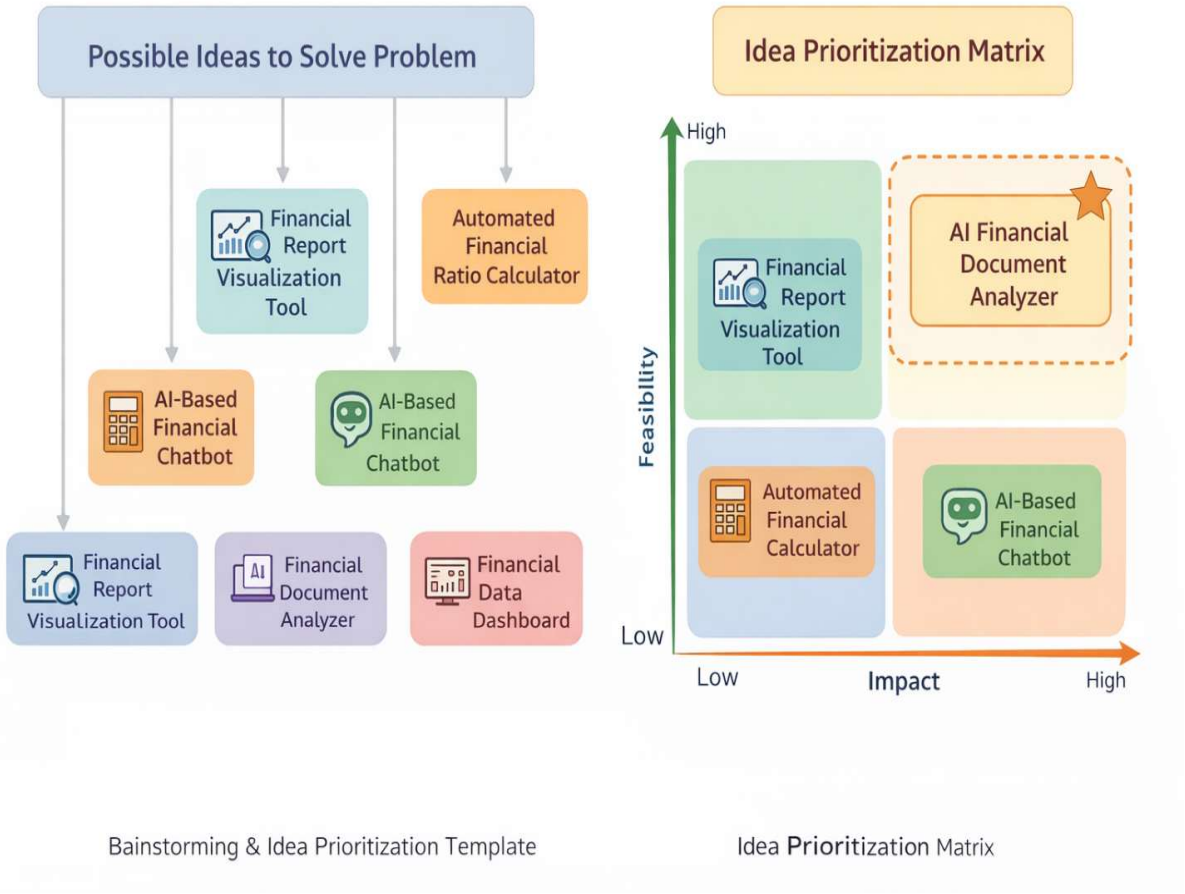
Selected Idea

After evaluating all ideas, the following concept was selected as the final project solution:

AI-Powered Financial Document Analyzer

This solution was selected because:

- It automates financial data analysis
- It uses Generative AI (Google Gemini) to generate meaningful insights
- It reduces manual effort in analyzing financial reports
- It helps both financial experts and non-experts understand financial data easily
- It provides visualizations for better interpretation



Final Selected Project Idea:

The final idea chosen for implementation is:

Financial AI Analyzer – Gemini Pro Financial Decoder

The system allows users to upload financial documents in CSV or Excel format, processes the data using Python and Pandas, and sends it to Google Gemini AI for analysis.

The AI model generates:

- Financial summaries
- Key metrics
- Important trends

- Data visualizations

This system helps users quickly understand financial data and make informed decisions.
